Front-end developer - Trial task

Your task is to build a simple image search engine:

- The page should have a text input field, and a search button.

- When a user searches for a term, the application connects to two services - Flickr and Pixabay - and displays on screen all the relevant images returned by those services.

- The page should include a table showing the history of searches (including the search term, service, time of search and number of results).

- Clicking on a table line reruns that search.

- Nice to have: a 'clear' button for the search history.

- The page should support Chrome/Firefox/Safari .

- The page's overall look and UX should be taken into consideration.

- Feel free to add any other features to the application that you see fit. Your solution can make use of existing web frameworks. In any case - code should be well organized so that it is accessible to other developers. No need to support mobile devices screen size / resolutions. Good Luck!
